#### **Evidence regarding disease outcome**

Minimal negative disease-related outcomes following pathogen exposure (primarily lack of mortality but also limited sub-lethal effects, such as weight loss)

# Conclusion regarding disease susceptbility of host

The focal host species is **non-susceptible** 

#### **Evidence regarding infection and pathogen load**

Following pathogen exposure, the focal host species remains uninfected, limits pathogen load, or reduces pathogen load over time, potentially clearing infection

#### **Conclusion regarding disease defense strategy of host**

The focal host species demonstrates pathogen resistance

### **Evidence regarding gene expression response of host**

Compared to unexposed controls of the same species, exposed hosts show substantial differential gene expression

#### **Conclusion regarding gene expression strategy of host**

The focal host species defends against disease using an "active" transcriptomic response that may distinguish it from more susceptible host species

#### **Evidence regarding infection and pathogen load**

Following pathogen exposure, the focal host species maintains infection at loads that lead to disease development in more susceptible host species

## **Conclusion regarding disease defense strategy of host**

The focal host species demonstrates pathogen tolerance

#### **Evidence regarding gene expression response of host**

Compared to unexposed controls of the same species, exposed hosts show **limited differential gene expression** (in some cases none)

#### **Conclusion regarding gene expression strategy of host**

The focal host species may defend against disease using **constituitively expressed genes or by limiting gene dysregulation** induced in
more susceptible host species upon exposure
